IN THE CLAIMS

Please amend the claims as follows:

1. (Amended) A resilient clip for use in securing a first member to a second member, the resilient clip comprising:

a flange portion having an aperture, the aperture adapted to receive a threaded fastener to couple the second member to the flange portion;

an insertion portion configured to be inserted into a hole formed into the first member, the insertion portion being coupled to the flange portion; and

a retaining portion coupled to the insertion portion and having first and second wing members, the first wing member being twisted about a first axis in a first direction, the second wing member being twisted about a second axis in the first direction, each of the first and second wing members terminating at a tip portion the tip portion of the first wing member and the tip portion of the second wing member being configured to co-engage the first member;

wherein each of the first and second axes are generally parallel a longitudinal axis of the retaining portion.

9. (Amended) The resilient clip of Claim 1, wherein the retaining portion includes first and second abutting flanges having a base that is spaced vertically apart from the first and second wing members, respectively, each of the bases of the first and second abutting flanges being configured to abut a surface of the first member opposite a surface into which the first and second wing members, respectively, are engaged.

23. (Amended) A resilient clip for engaging a structure, the resilient clip comprising:

a body portion having a pair of flanges, a pair of wing members and a pair of abutting members, each of the wing members having a base portion coupled to an associated one of the flanges, a first one of the wing members being twisted about a first axis in a first direction, a second one of the wing members being twisted about a second axis in the first direction, each of the wing members terminating at a tip portion that is angled downwardly toward the base portion such that a portion of an associated one of the wing members nearest a central axis of the body portion extends above an associated portion of the wing member furthest from the central axis of the body portion, the tip portion of the wing members being configured to co-engage a first side of the structure and position a second side of the structure against the abutting members.

38. (Amended) A resilient clip for engaging a structure, the resilient clip comprising a body portion for insertion downwardly into a hole formed in the first structure, the body portion including a plurality of wing members, each of the wing members terminating at a tapered tip portion, each of the tip portions being twisted about an axis such that an inwardly twisted end of the tip portion is positioned above an outwardly twisted end of the tip portion, each of the plurality of wing members including a plurality of teeth for engaging a surface of the structure.

41. (Amended) A resilient clip for use in securing a first member to a second member, the resilient clip comprising:

a flange portion having an aperture, the aperture adapted to receive a threaded fastener to couple the second member to the flange portion;

an insertion portion configured to be inserted into a hole formed into the first member, the insertion portion being coupled to the flange portion; and a retaining portion coupled to the insertion portion and having at least three wing members, each of the wing members being twisted about an associated axis and terminating at a tip portion, each tip portion being configured to co-engage the first member.

~~43. (Amended)~~ The resilient clip of Claim 42, wherein each of the flanges further includes a fastener aperture formed into the first and second portions, the fastener aperture ~~being configured~~ to provide clearance for the fastener.

49. (Amended) A resilient clip for engaging a first structure to a second structure, the resilient clip comprising:

a body portion having a pair of flanges and first and second wing members, each of the wing members having a base portion coupled to an associated one of the flanges, the first wing member being twisted about a first axis in a first direction, the second wing member being twisted about a second axis in the first direction, each of the wing members terminating at a tip portion that is angled downwardly toward the base portion such that a portion of each of the wing members nearest a central axis of the body portion extends above an associated portion of each of the wing members that is furthest from the central axis of the body portion, the tip portions being configured to engage a first side of the first structure to secure the resilient clip to the second structure.
